WHITE ROSE LAWN SEEDS

MERION BLUE GRASS

A distinct, new variety of superior lawn grass which is not only the best, but in the long run the most economical.

Merion Blue Grass is a distinct variety discovered growing among Kentucky Blue Grass on a tee of the Merion Golf Club, near Philadelphia. In the years that have followed it has been tested by golf clubs, experimental stations, and private growers in all parts of the U.S.A.

The merits of Merion as viewed by turf experts who have grown it and inspected various test plantings, may be listed as follows:

- Spreads faster than Kentucky Blue Grass.
- Needs less mowing because of spreading growth.
- Stands closer mowing than Kentucky Blue Grass.
- Makes better turf in quality and appearance.
- Resists weeds better, particularly crab grass.
- Resists disease, especially leaf spot.
- Stands heat and drouth better.
- Has darker green color.
- Highest rating at turf trials.

BOVUNG

BOVUNG contains Vitamins B1 and other members of the Vitamin B complex, and animal hormones. The study of these complex plant growth substances is a new field of research and there is much that is still unknown about their value to plants. Their beneficial effect may in some cases be indirect, resulting from the stimulation of soil bacteria which in turn releases plant food. These substances are largely soluble in water and may be lost from ordinary manure, from which the liquid part is allowed to drain or wash away. Practically all the liquid is retained in the manure that is used to produce BOVUNG and thus these plant growth substances are preserved.

How to Grow Bush Lima Beans

Bush Lima Beans succeed well in almost any good garden soil but do best in a rich, well-drained, sandy loam. As seed is sensitive to cold and wet ground, it must not be planted until the soil has become quite warm and fairly dry. Plant the seeds edgewise, eye down, 5 in. apart in rows 2 1/2 to 3 ft. apart, and cover with 2 in. of fine soil. When the plants are well started, thin to stand 12 to 15 in. apart for large-seeded varieties and 9 to 12 in. for small-seeded varieties. Give frequent and shallow cultivation until blossoms appear, but do not cultivate or handle plants when they are wet. A pkt. of large-seeded varieties will sow 15 ft. of row; one lb. 100 ft.; the small-seeded kinds will, of course, go much farther.

New 15c Garden Can inoculates up to 8 lbs of seed. NITRAGIN inoculation promotes better quality and increases yields of SWEET PEAS,

GARDEN PEAS, LUPINES, GARDEN BEANS, LIMA and EDIBLE SOYBEANS. Directions for inoculating seed on side label of can.

Lima Beans (Pole)

Plant about the first to the middle of May. One quart will plant 150 hills, 12 quarts to the acre. Wait until soil is warm before planting. Plant six beans to the hill, let three of the best plants stand.

KING OF THE GARDEN—Very prolific, and of very fine quality. The pods contain 4 to 6 beans.

Pkt. 10c; 1/2 lb. 35c; 1 lb. 60c; 5 lbs. \$2.75; 10 lbs. \$5.00.

BROCCOLI

One ounce will produce about 1500 plants. Used in the same manner as cauliflower, and the culture is the same.

ITALIAN GREEN SPROUTING—Used largely by market gardeners and home gardens. Tall branching plant, resembling a loose head of cauliflower. It is a highly desirable, delicious vegetable, steadily gaining in favor.

Pkt. 10c; 1/2 oz. 30c; oz. 50c; 1/4 lb. \$1.50.

ACP Soil Conditioner

is a combination of the most effective soil stabilizers PAC (modified polyacrylonitrile) and VAMA (vinyl acetate maleic polymer) with trace elements and plant hormones added. The powder can be added directly to the soil, or can be added to water and then sprinkled on the soil. Properly applied, it turns hard clay and similar problem soils into loose, easily cultivated soil. The improved structure discourages packing, crusting and cracking after heavy rains. Water penetration and absorption is increased, and there is better aeration for root growth. ACP SOIL CONDITIONER is not a fertilizer but it makes fertilizers and nutrients more readily available to plant roots, thus stimulating and increasing growth.

INCREASE INFILTRATION OF WATER

INCREASE WORKABILITY OF SOIL

INCREASE AERATION, ENABLING EARLIER PLANTING

INCREASE THE EFFICIENCY OF PLANT NUTRIENTS

ACP SOIL CONDITIONER is licensed under the Monsanto Soil Conditioner Patents issued under U.S. Pending Application. It contains both PAC (modified polyacrylonitrile) and VAMA (vinyl acetate maleic polymer) the only time-tested soil conditioning chemical on the market today.
